Pancreatic Disease

Pancreatic cancer is known as a "slient" disease because identifiable symptoms are not usually present in the early stages of the disease. Many symptoms of pancreatic cancer are mild at first, so patients may often be unaware of the potential seriousness of them.

Pancreatic Disease

Pancreatic cancer can form in exocrine cells and neuroendocrine cells. The exocrine type is more common and is usually high grade with a poor prognosis. It has a higher rate of recurrence. The neuroendocrine cells are more common and have a better prognosis. Start here to find information on pancreatic cancer treatment, research, and statistics.

Pancreatic cancer: Symptoms, causes, and treatment

Pancreatic cancer is often called a "silent" disease, because symptoms do not usually present in the early stages of the disease. Many symptoms of pancreatic cancer are mild at first, so patients may often be unaware of the potential seriousness of them.

Pancreatic cancer, an easily treated disease in the early stages, can be one of the most deadly cancers if not treated properly.

Pancreatic cancer is a type of cancer that forms in the pancreas.

The pancreas is a gland located behind the stomach and in front of the spine. The pancreas is involved in two important processes:

Making pancreatic juices, which help digest food in the small intestines, and hormones, including insulin.

Pancreatic Diseases - National Cancer Institute

Most people with pancreatic cancer have an otherwise healthy pancreas. Symptom-related disorders are more common in people with pancreatic cancer.

Pancreatic cancer: Etiology - National Cancer Institute

Pancreatic cancer is a disease in which malignant (cancer) cells form in the tissues of the pancreas. The pancreas is a gland located behind the stomach and in front of the spine. The pancreas is involved in two important processes:

Making pancreatic juices, which help digest food in the small intestines, and hormones, including insulin. The pancreas also plays a role in type 1 and type 2 diabetes.

Pancreatic Disorders - Mayo Clinic

Pancreatic cancer is a disease in which malignant (cancer) cells form in the tissues of the pancreas. The pancreas is a gland located behind the stomach and in front of the spine. The pancreas is involved in two important processes:

Making pancreatic juices, which help digest food in the small intestines, and hormones, including insulin. The pancreas also plays a role in type 1 and type 2 diabetes.
